

# Release Notes

# Prism Suite v.13.2

---

Prepared by the Product Management Team at New Boundary Technologies for release with Prism Suite 13.2 (build 13.2.1.7)

Prism Suite 13.2 is a maintenance release that contains several customer-requested enhancements, performance improvements and bug fixes. The changes are described in detail below. Customers who have experienced any of these issues are advised to upgrade to Prism Suite 13.2 at their earliest convenience.

### Customer-Requested Enhancements

- The NBT Proxy Service is used to ensure that laptops that go off the corporate network can still communicate securely with the Prism Server over http or https. In this release, changes were made to the Prism client's behavior when *Use Web Proxy* configuration is set to *Auto*. To ensure the client won't get "stuck" using the NBT Proxy even when it is back on the corporate network, the client will now regularly attempt to switch back to direct communication.
- The Prism client's first-ever contact time with the channel is now available via *More Fields* on the Managed tab and in the Computer Status report.
- Typing an incorrect password in the channel login dialog no longer forces you to also retype the user name when retyping the password.
- Computers that are in different domains but have the same hostname are now managed and displayed correctly in the Console simply by making the AD Folder field visible on the managed tab, allowing computers to be distinguished from each other.

### Performance Improvements

- Report memory management has been improved, resulting in much faster opening times.
- Switching between the Managed and Configuration Groups tabs is now faster in channels with many computers and/or many configuration groups.
- Very large reports no longer occasionally freeze when the console's reports are configured to use the optional direct-to-SQL setting.

### Bug Fixes

- MSI tasks that were configured to allow unattended installation or to run as a named account could fail with "task file not found." This has been fixed.
- In certain circumstances, the *Last Poll* time for clients with the status of *Offline (guessed)* was not accurate. This has been fixed.
- Setting Distribution Location credentials no longer overwrites existing credentials with the new values.
- The Last Poll column now sorts correctly as a date/time field.
- Nessus and other security scanners no longer identify Prismxl service as a possible security threat.
